

Case Study—Particle Counter Calibration

Summary

Project: Service—Air Particle Counter Calibration Visit
Location: Glasgow
Client: AMRI Global

Project

Particle counter calibration visit by our service department, ahead of our client's planned shutdown.

Project Specification

Requirement to calibrate eleven continuous air particle counters situated in the AMRI cleanroom facility, providing compliant, continuous air particle counting to cleanrooms, LAF's and RABS.
The customer required the calibration work to be carried out in a timescale which allowed additional contractors access their facility, reducing contractor overlap.

Project Outcome

Using our flexible and accommodating approach we were able to help our client get their particle counters calibrated efficiently to meet with their planned shutdown program. This allowed the customer to seamlessly start production again on their planned date.

“Having worked with Pharmagraph for a number of years now, I am always impressed by how well they respond to my requests, which can be short notice and complex at times, plus I always have a tight deadline to meet! Turnaround time for documentation is excellent, which is a Godsend as we never have to chase paperwork. They are always willing to share the latest industry innovations and updates, it is a pleasure dealing with everyone at Pharmagraph.”
